

Intro to Earth Science

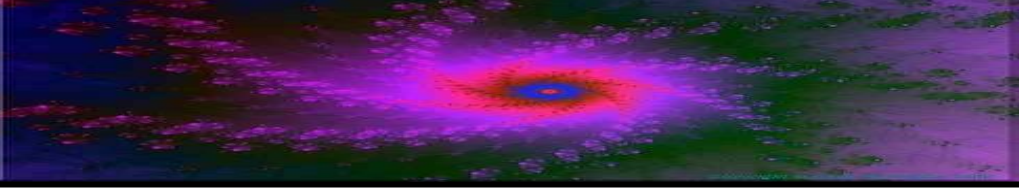

Observations, Inferences, Classification

What is used to make an observation?

the five senses

Scientific Instruments (Help with observations)

	 Common Instrument
Volume of Regular, Rectangular Objects (a box)	ruler
Volume of Irregularly Shaped Objects (rocks)	graduated cylinder
Mass	scale
Distance	ruler
Time	stop watch

After observations have been collected. What does it mean to make an inference?

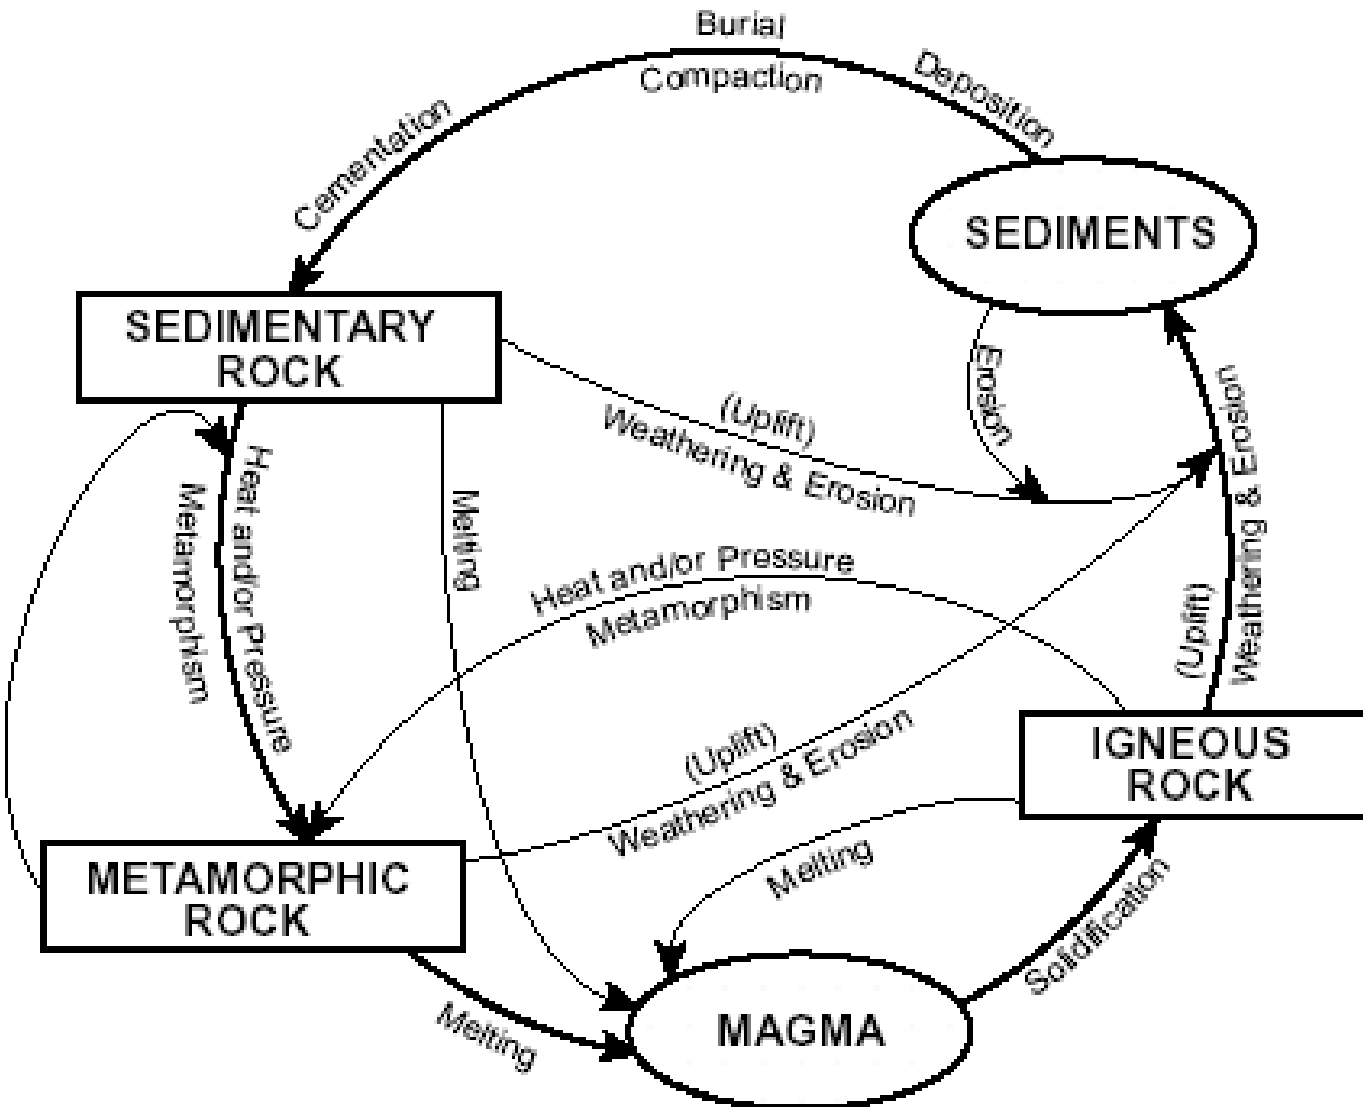

**make an educated guess
(an hypothesis)**

**We use the observations made to
classify objects.**

**Give some examples of how you
use classification systems.**

Give examples of how scientists use classification systems.

Types of ROCKS

Give examples of how scientists use classification systems.

Types of STARS

YouTube Videos 1.1

Graphical Relationships

A. Direct Relationship.

As one variable increases, the other increases.

Examples:

- Population vs. Pollution
- Hours you study vs. Grades

B. Inverse Relationship

As one variable increases, the other decreases.

Examples:

- Distance vs. Magnetic Attraction
- Elevation vs. Temperature

C. Cyclic Relationship

As one variable increases, the other

Changes in a Pattern

Examples:

- Moon Phases
- Yearly Temperature

*Events that are cyclic are also **Predictable** !

D. No relationship.

As one variable increases, the other **Stays the same**.

Examples:

- Time vs. Mass
- Times vs. # of Planets

Complete pages 6-9 in notes packet
YouTube Videos 1.2

Earth Science Math and You

(The Basic Math You Need to Know)

- 1) Rounding
- 2) Subtracting Time
- 3) Scientific Notation

Complete page 10- 11 in notes packet

Rate of Change

**How the variable (something) changes
over a period of time.**

Formula for
Rate of Change

$$\text{Rate of Change} = \frac{\text{change in value}}{\text{time}}$$

Complete page 12 and 13 in notes packet

DENSITY:

Density of Matter

Density :

- The amount of matter in a specific volume.
- How close or compact the molecules are.

Formula:

$$\text{Density} = \frac{\text{Mass}}{\text{Volume}}$$

*** Know the Density Triangle***

A. Density Properties:

- **The same objects (material) have the same density.**
- **Density does not change if a material is broken in half.**

You need to Remember This!!

Cutting or breaking an object does **NOT** change its density!

Complete pg 14 and 15 in Notes Packet
YouTube Videos 1.2, ESRT1b

B. Change in Density:

Two factors that do effect density are Temperature and Pressure

1. **Temperature** As temperature increases, molecules begin to move a part (expand), which means the volume increases.

(a) Warm air Rises because it is Less dense.

An example would be a Hot Air Balloon

(b) State the relationship between temperature and density.

As **Temp. Increases**,
Density Decreases

(c) Draw the relationship between temperature and density in the graph below.

Phases of Matter & Density

During which phase of matter (solid, liquid, or gas) are most materials:

most dense?

solid

least dense?

gas

Phases of Matter:

- (a) Most materials have their greatest density as a Solid
- The exception is water, because water Expands when it freezes.
- (b) Water is at its greatest density at a temperature of 3.98 °C
- The density of water is 1.0 g/ml

Density

$$\text{Density} = \frac{\text{Mass}}{\text{Volume}}$$

(c) If an object floats on water, it is Less dense than the water.

If an object sinks in water, it is More dense than the water.

2. **Pressure:** When pressure is added, it causes the material to become smaller (compress), volume decreases.

(a) State the relationship between pressure and density.

As **Pressure Increases**,
Density Increases

(b) Draw the relationship between pressure and density in the graph below.
